Managed Security Services

Over a quarter of a million new malware is detected every day. JOS Managed Security Services are designed to help companies alert of these and other threats, without stretching tight budgets or overloading hard-working IT staff.

JOS leverages partnerships with leading Security Information and Event Management (SIEM) vendors to centralise the entire process. That includes supporting security devices to 24x7 monitoring and providing strategic recommendations for enhancing security.

Vulnerability Assessment and Advisory
An in-depth evaluation of existing infrastructure which helps identify and eliminate potential trouble-spots and implement standard configuration protocols for infrastructure components. Hardening services, including disabling unnecessary services, can add extra protection.

Access Management
Includes regular reviews of all accounts with privileged access. Access to data and applications servers are also carefully scrutinised to ensure that only authorised users are permitted.

Security Device Management
Complex infrastructure also creates significant security device overhead. Leveraging resources and partnership with SIEM vendors, JOS can help control those costs without compromising protection.

Security Incident Management
Delivers an end-to-end process to manage service interruptions and resume operations as quickly as possible, minimising the impact on the business.

Event Correlation Analysis
If a breach does occur, event correlation analysis can be an invaluable instrument for forensic investigators and reduce the probability of a recurrence.
